Problem Statement:
Organization has a vast multitude of functions including adjudicatory and regulatory functions, compliance monitoring etc. Accordingly, lot of regulatory compliance data needs to be submitted by various sector stakeholders. Monitoring, validating and interlinking this data for regulatory functions are tedious task.

**Desired outcome** – It is intended that By the use of block chain technology the regulatory compliance data may be automatically collected/validated from published data from the stakeholders website in a secure manner without having it to manually entering/uploading on the organization portal. The fetched data is in the form of database that may later be used for data analytics/trend analysis/regulatory compliance purpose.
